

Portfolio Project Report by Eldar Ibrahimli 22091000383 03.07.2024

This project is my own portfolio that I made not only for the Final Project but also for the use in the work fields presents my background, skills, and projects and also shows the full-stack web development concept that I learned during the semester.

Technologies Used

- **HTML5**
The structure of a website.
- **CSS**
The styling layer.
- **JavaScript**
The programming language of the browser. For the Interactions on the website.
- **PHP**
A server-side programming language. I used it for the login page.
- **Supabase**
A database program used to read the messages and add the project to the site.
- **AJAX / Fetch API**
Ways for JavaScript to send and receive data from a server without reloading the page.
- **INFINITYFREE**
A web hosting service where I uploaded my site file and where it is possible to run them from any device.

The Features Of The Site

- Portfolio homepage
- Mobile Version
- Dark mode in both normal and admin page
- Contact form with JavaScript validation
- Messages that are stored in database
- Projects that are added, deleted and stored in database
- Admin login for managing the projects
- Edit adding and deleting functionality

Net page ->

FrontEnd Side

In the frontend part of the project(which are [index.html](#), [style.css](#) and [script.js](#) for normal and [login.php](#), [admin.php](#) and [admin.js](#) for admin side of the frontend) I created the User Interface, navigation panel, dark mode, buttons text panels, the sections of the site like project skills and etc. And the admin login page and the add/edit/delete page.

I used CSS for the styling in the site like buttons, background, image sizes, padding margins, flexbox and etc. I also made the alternative dark mode to use the site comfortably at night.

I added Javascript for interactivity like dark mode toggle, mobile compatability, project data loading , contact form.

BackEnd Side

For the backend side of the project I used PHP to handle the server side logic and connected the database to the website. I used PHP for processing requests from the frontend like loading the project data, saving the message contacts and managing the projects from the admin panel.

Database

I used Supabase to store the database side of the project. I created two main tables there: projects and messages using SQL editor, they store data such as title category, description, technologies links and images for the projects table and name email subject and message for the messages table.

When the homepage loads PHP retrieves the project data from the database and sends it back to the frontend. For example when the use sends feedback PHP retrieves it and stores it to the database. PHP is also used in the admin panel to add, delete ad edit the projects.

The tables and code for the tables

<table><tr><td>messages</td><td>:</td></tr><tr><td>id</td><td>int8</td></tr><tr><td>name</td><td>text</td></tr><tr><td>email</td><td>text</td></tr><tr><td>reason</td><td>text</td></tr><tr><td>subject</td><td>text</td></tr><tr><td>message</td><td>text</td></tr><tr><td>created_at</td><td>timestampz</td></tr></table>	messages	:	id	int8	name	text	email	text	reason	text	subject	text	message	text	created_at	timestampz	<table><tr><td>projects</td><td>:</td></tr><tr><td>id</td><td>int8</td></tr><tr><td>title</td><td>text</td></tr><tr><td>category</td><td>text</td></tr><tr><td>description</td><td>text</td></tr><tr><td>technologies</td><td>text</td></tr><tr><td>project_link</td><td>text</td></tr><tr><td>image_url</td><td>text</td></tr><tr><td>created_at</td><td>timestampz</td></tr></table>	projects	:	id	int8	title	text	category	text	description	text	technologies	text	project_link	text	image_url	text	created_at	timestampz
messages	:																																		
id	int8																																		
name	text																																		
email	text																																		
reason	text																																		
subject	text																																		
message	text																																		
created_at	timestampz																																		
projects	:																																		
id	int8																																		
title	text																																		
category	text																																		
description	text																																		
technologies	text																																		
project_link	text																																		
image_url	text																																		
created_at	timestampz																																		

```
1 create table public.projects (  
2   id bigint generated always as identity primary key,  
3   title text not null,  
4   category text not null,  
5   description text not null,  
6   technologies text not null,  
7   project_link text,  
8   image_url text,  
9   created_at timestampz default now()  
10 );  
11  
12 create table public.messages (  
13   id bigint generated always as identity primary key,  
14   name text not null,  
15   email text not null,  
16   reason text not null,  
17   subject text not null,  
18   message text not null,  
19   created_at timestampz default now()  
20 );  
  
alter table public.projects enable row level security;  
alter table public.messages enable row level security;  
  
create policy "Public can read projects"  
on public.projects  
for select  
to anon  
using (true);  
  
create policy "Anyone can send messages"  
on public.messages  
for insert  
to anon  
with check (true);
```
